Quick one, after re-installing my Notebook, I had to configure lot of things again and I wasn't happy with my earlier Python venv setup.

I was taking a deeper look into pipx and I think that's way easier to use. It just take care about a venv per package that I'm going to install, I don't have to take care about anything on my own.

I tried it and after learning about the *inject* feature, mentioned by [cs01](#) in a [GitHub Issue](#) (Archive: [\[1\]](#), [\[2\]](#)) it was no problem to install Pelican including some Plugins via pipx:

```
pipx install pelican
pipx inject pelican pelican-pdf
pipx inject pelican markdown
pipx inject pelican pelican-read-more
```
