Status: published

As already mentioned in my Post [Migration from Wordpress to Pelican](#) the fact that Pelican is written in Python and provide a Plugin system was important for me. So I can adjust the Code and also give something back to the [Pelican Community](#)

The Project is moving away from their [monolithic Plugin Repository](#) to a separate [Organization Namespace](#) were every Plugin has it's own Repository and get published to [PyPI](#).

Due to the fact that i wanted to use the [PDF Generator](#) but it wasn't yet migrated, i decided to [contribute](#) (Archive: [\[1\]](#), [\[2\]](#)) and assist with updating and migrating this Plugin.

Today I proudly present: [My first accepted Pull Request for Pelican \(PDF Plugin\)](#) (Archive: [\[1\]](#), [\[2\]](#))

There is still room for improvement and i'm working on further fixes and features, but it's a starting Point.

You find at the bottom of every Article and Page a PDF Download Link, the linked PDF file was generated by the mentioned Plugin.
