transid: release-moinmoin-wiki-container-powered-by-pypy2
Status: published

Today I published the first version of **moinmoin-pypy2-container**, a ready to use image to run MoinMoin Wiki, based on openSUSE Leap.

It contains some enhancements regarding the initial wiki setup to make it easier to get started and already ships with a pre-configured nginx.

Latest stable release of [MoinMoin](#) was 8th November 2020 and requires Python 2, development of the successor [moin2](#) is ongoing but wasn't released yet.

moin2 supports Python 3, but there is still a lot to do and the Project could use some [help](#), what about a [good first issue](#)?

It might be that User still want to keep using the latest stable release and wait with the migration for a while.

Besides minor enhancements, the main goal of **moinmoin-pypy2-container** is to provide a easy to use alternative to keep using MoinMoin.

The official Python 2 Runtime is [End-of-Life](#). But PyPy will support Python 2 "[forever](#)" and still provide updates in future.

Please check the **README** in the below linked Source code Repository for further details about the *features* and *usage*.

The repository is available on [Codeberg](#) (Primary), [Gitlab](#) (Mirror), [Github](#) (Mirror).

Pre-build Container Images can be downloaded from [quay.io](#).
