I'm using Sky Ticket (Germany) from time to time and got one of their TV Sticks, powered by Roku, for free. Had to learn that Roku connects to a few Domains which are on blacklists used by Pi-hole and uBlock Origin.

Was surprised that I can use Sky Ticket directly from a (Windows...) Notebook, without adjusting anything on my Pi-hole settings, but it fails when using the Roku Stick.

Without adding `scribe.logs.roku.com` and `dpm.demdex.net` to the Pi-hole whitelist, it's impossible to connect to Sky Ticket, Roku complains always that *"something went wrong"*.

Both seem to receive a lot of usage data and track everything what's done on the UI. I think that's just weird and unnecessary, looks like something all Roku devices do.

Not really what I expect, paying for a Service and running in such issues, but if they happy to track how I navigate in the UI and decide what to watch, so it be...
